$$T(n) = 9T(n/3) + n^2 \text{ so } a = 9, b = 3 \text{ and } f(n) = n^2$$
 Is $n^2 = \Theta(n^{\log_3(9)})$? [Rule 2] Is $n^2 = \Theta(n^2)$? True.
$$\therefore T(n) = \Theta(n^2 \log n)$$

$$\frac{b:}{\sum} T(n) = 4T(n/2) + 100n \text{ so } a = 4, b = 2 \text{ and } f(n) = 100n$$
 Is $100n = O(n^{\log_2(4) - \epsilon})$? [Rule 1] Is $100n = O(n^{2-\epsilon})$? True.
$$\therefore T(n) = \Theta(n^2)$$

$$\frac{c:}{\sum} T(n) = 2^n T(n/2) + n^3 \text{ so } a = 2^n, b = 2 \text{ and } f(n) = n^3$$
 $a \text{ is not constant } \therefore \text{Master Theorem cannot be applied.}$
$$\frac{d:}{\sum} T(n) = 3T(n/3) + cn \text{ so } a = 3, b = 3 \text{ and } f(n) = cn$$
 Assuming $c \text{ is constant term then Master Theorem can be applied.}$ Is $cn = \Theta(n^{\log_3(3)})$? [Rule 2] Is $cn = \Theta(n)$? True.
$$\therefore T(n) = \Theta(n \log n)$$

$$\frac{e:}{\sum} T(n) = 0.99T(n/7) + 1/(n^2) \text{ so } a = 0.99, b = 7 \text{ and } f(n) = 1/(n^2) = n^{-2}$$
 Master Theorem can be applied if $a \ge 1$. $a = 0.99 \therefore \text{Master Theorem cannot be applied.}$
